

Tony Duong

Software Engineer • Backend / Full-Stack

📍 Tokyo, Japan ✉ tony.duong.102@gmail.com 🐙 github.com/tonystrawberry 🌐 shirimono.fun

Full-stack engineer based in Tokyo with ~8 years building web applications end-to-end — Ruby on Rails backends, React/Next.js frontends, and the AWS infrastructure underneath. I like owning features from API to deploy, paying down the boring parts (observability, cost, test speed), and learning deeply — currently working through Designing Data-Intensive Applications and AWS certifications. Comfortable shipping in three languages, English, French, and Japanese.

01. Experience

Software Engineer • Backend • Spacely

~2023 – Present

Tokyo, Japan

Backend team for an AI-driven image-processing product (panorama enhancement, generative editing for real-estate imagery).

- ▶ Owned several AI image features end-to-end — generative content removal/placement and an AI contextual chat — building the CRUD APIs, file-attachment handling, and technical specs.
- ▶ Re-architected the panorama-enhancement pipeline from a Lambda CPU setup to an ECS GPU setup to meet response-time requirements, documenting the decision in an ADR.
- ▶ Cut a slow image endpoint from ~2 minutes to ~20 seconds for 50 images by optimizing the save flow, and resolved a production deadlock affecting the main web app.
- ▶ Organized ~120 Datadog monitors (consistent naming, ownership tags, ANOMALY/LATENCY categories) and added per-job error alerting; revamped SLO/SLI dashboards for accurate health reporting.
- ▶ Contributed to driving Honeybadger alerts down from ~9k to ~3.2k in two months by clearing a backlog of recurring exceptions.
- ▶ Built funnel/observability analytics on BigQuery and set up Claude Code GitHub Actions to auto-review Dependabot PRs.
- ▶ Improved team process: introduced ADRs, a round-robin PR-review rotation, and onboarding paths; mentored teammates through pairing and code review.

GitHub Actions

Software Engineer (Consulting) • Monstarlab

~2022 – 2023

Tokyo, Japan

Global digital consultancy delivering client web applications across varied stacks and domains.

- ▶ Joined to broaden across clients, stacks, and problem domains after several years inside single-product teams.
- ▶ Delivered backend and full-stack work on client engagements, leaning on prior Rails and AWS experience to ramp quickly.

TypeScript

PostgreSQL

Software Engineer • Overflow

~2020 – 2022 (~2.5 yrs)

Ebisu, Tokyo, Japan

First full-time engineer at a startup building Offers, a job-matching platform for engineers and designers.

- ▶ Helped build Offers, a job-matching platform for engineers and designers, working day to day with product managers and designers to take features from idea to ship.
- ▶ Built a Slack integration that notified recruiters and job seekers in real time when a matching position came up.
- ▶ Worked on Offers Magazine, a digital engineering-and-design magazine: built the frontend in Vue.js from designer hand-offs (often HTML/CSS) wired to real data, and got hands-on with AWS CloudFront, WAF, and S3 plus a WordPress headless-CMS backend.
- ▶ Built a performant analytics tool on AWS Redshift, aggregating and extracting analytical data through complex SQL queries.
- ▶ Started out following the senior engineer's lead and quickly grew into an engineer who proposed solutions and designed new features, not just implemented them.
- ▶ Operated day to day in Japanese — spoken and written — making clear written communication a core strength; used Datadog and New Relic for observability.
- ▶ Promoted within the first year and recognized as a roughly top-5% performer; grew from shipping fast to shipping well under a strong mentor.

Datadog

New Relic

Software Engineer • Seido

2018 – ~2020

Tokyo, Japan

Sole developer at a seven-person e-commerce business (Japanese martial-arts gear), building internal tooling from scratch.

- ▶ Built a shipment system integrating the Shopify API with DHL, Japan Post, and FedEx, plus a parcel-tracking dashboard that normalized each carrier's API into one view.
- ▶ Wrote accounting/revenue and tax-declaration tooling, Google Apps Script automations for the order pipeline, and Tampermonkey scripts to patch third-party UIs.
- ▶ Shipped daily on Rails + PostgreSQL on Heroku as a one-person engineering team — then used the tools in the warehouse myself, which Jordy (CEO) credited with measurably moving the company's productivity forward.

Google Apps Script

Software Engineering Intern (VR) • Summit Tech

2017 – 2018 (4 mo)

Montreal, Canada

Telecoms company; master's internship.

- ▶ Built a Unity VR game prototype integrating the company's internal video-call APIs, shipped as a client-facing demo alongside their telecoms platform.

Unity

C#

02. Projects

Shirimono

Japanese-learning app, rebuilt from scratch and shipped on the App Store. AI-generated exercises (Claude Skills), Vertex AI TTS audio, a JLPT N2 course, public multi-locale resource pages, and CloudFront-served assets. Migrated the backend from Render to a single Hetzner VPS with Kamal, saving ~\$60/month.

PostgreSQL

Kamal

Hetzner

Vertex AI

Claude

This site — blog + digital clone

A trilingual (fr/en/ja) Next.js 16 blog with a streaming Claude chat grounded in the site's content, a real-time ActionCable chat, and an automated translation pipeline (Claude Code + GitHub Actions) that translates new English posts into French and Japanese.

Next.js 16

TypeScript

Tailwind CSS v4

Claude

Rails ActionCable

rails-openapi-generator

A Rails gem that generates complete OpenAPI documentation from source code, with first-class integration for the rails_param library. Built spec-first with spec-kit.

Ruby

Rails

OpenAPI

tonystrawberry-mcp-server

A Ruby MCP (Model Context Protocol) server exposing tools that answer questions about me from Markdown profile files.

Ruby

MCP

brag-slack-cli

A CLI that turns your Slack messages into accomplishment summaries for performance reviews.

Ruby

Slack API

LLM

Axie Infinity gene overlay (earlier)

A Tampermonkey extension that pulled each Axie's genes from the API and overlaid them on marketplace listings the site didn't expose. Shared in the game's Discord, it hit hundreds of downloads a day and ~\$30/day at peak via a one-time Stripe unlock.

JavaScript

Stripe

03. Skills

Backend

Ruby on Rails · Ruby · Node.js · Python · GraphQL · REST APIs

Data

PostgreSQL · MySQL · Redis · Redshift · BigQuery

Observability

Datadog · New Relic · Honeybadger

Frontend

React · Next.js · Vue.js · TypeScript · JavaScript · Tailwind CSS

Cloud & Infra

AWS (ECS, Lambda, S3, CloudFront, RDS, Route 53, IAM) · Docker · Kamal · Heroku · Vercel

AI & Tooling

Claude / Claude Code · MCP · Vertex AI · RAG · Spec-driven development

Practices

CI/CD (GitHub Actions) · TDD / RSpec ·
ADRs · Code review · i18n

04. Education

UTBM (France) · ÉTS Montréal (Canada)

Engineering double degree — Computer / Software
Engineering (Master's level)

2016 – 2018 · Belfort, France · Montreal, Canada

06. Languages

French	Native
--------	--------

English	Fluent
---------	--------

Japanese	Conversational (works in Japanese daily)
----------	--

05. Certifications

AWS Certified CloudOps Engineer – Associate

Amazon Web Services · 2026
